

IGU Manufacturing Process

IGU manufacturing process involves 2 main steps: 1. Glass cutting and 2. Glass cleaning and drying. The process starts with raw material (float glass) which is cut into specific sizes and cleaned. The cleaned glass is then dried and prepared for the next steps.

The process involves cutting glass into specific sizes (e.g., 3300x8000mm) and cleaning it. The cleaned glass is then dried and prepared for the next steps. The process involves cutting glass into specific sizes (e.g., 3300x8000mm) and cleaning it. The cleaned glass is then dried and prepared for the next steps.

Raw material

Glass cutting machine

Glass cleaning and drying machine

Finish Product

Injected sealant machine

Aluminum frame folding machine
